HACKMERIDIAN 2026 · SCALE TRACK

# Radox Custody Rail

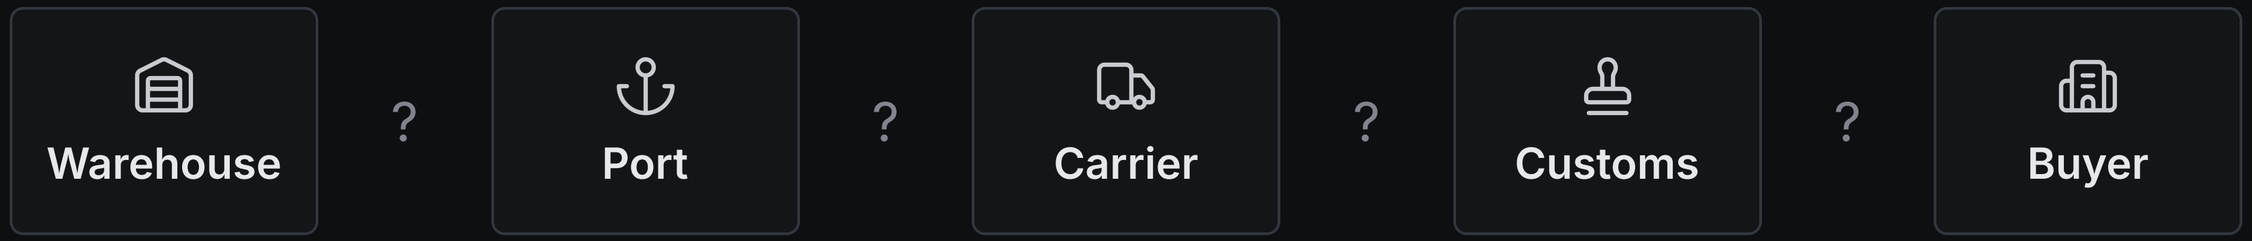

## SWIFT for goods in transit, on Stellar

Every handover signed by both companies, checkable by anyone.

Running on Stellar testnet.

PROBLEM

# One container, five parties, five separate records.

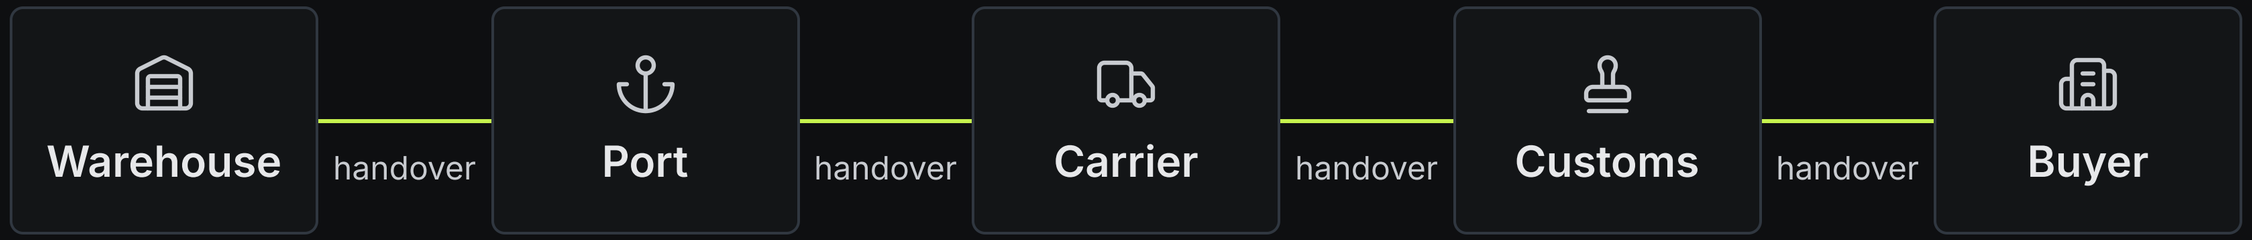

None of them can check what the others say about who held the goods.

Why now: carriers are digitizing ocean bills of lading, but only 5.7% were electronic in January 2025 (DCSA). The record shared between companies is still missing.

SOLUTION

# One shared record. Both companies sign every handover.

## Both sign

The company giving the goods and the one receiving them both sign.

## Nobody rewrites

Each step is chained to the one before, so no one can rewrite history.

## Anyone checks

A buyer, insurer or lender checks the whole history against one public 32-byte value.

TARGET USERS

# The companies that hand over goods, and the ones that pay on them.

THEY SIGN

**Warehouses, ports, carriers, customs, buyers**

THEY CHECK

**Buyers, insurers, lenders**

First corridor: US–Brazil. Later, any Stellar issuer of a tokenized good, through the open spec.

VALUE PROPOSITION

# Every handover becomes proof that lenders can check.

## Lenders see the proof

Lenders and insurers will see which company last signed for the goods before paying.

## Companies prove their leg

Your handover carries the receiver's signature, so you can show you passed the goods.

## Cargo token, linked record

Each cargo token links to one shipment record of signed handovers.

Proof on Stellar testnet.

PROOF

# Live on Stellar testnet. Check every handover yourself.

**7**

transactions: one shipment from open to delivery and burn

**9**

refusal cases, each rejected in simulation (wrong signer, out of route)

**MATCH**

anyone recomputes the head from Horizon

Second shipment: two teammates signed handovers on their own computers.

Local mainnet-state dry run, nothing sent: 15 transactions applied, 9 refusals rejected, 13.72 XLM gross simulated fees.

MARKET OPPORTUNITY

# 45 million ocean bills of lading a year. Each one a chain of handovers.

**45M**

ocean bills of lading issued a year

DCSA, Feb 2023

**~180M**

custody handovers a year, if every bill of lading had our 4 signed handovers

Illustration, not a forecast

**US$2.5T**

global trade finance gap

ADB, Dec 2025

Illustration: 45M × 4 handovers; the 4 is our design assumption.

BUSINESS MODEL

# Companies on the route subscribe, and pay per shipment.

SUBSCRIPTION

per connected company

FEE

per shipment on the rail

OPEN RECORD

checking needs no signature and no account

Every handover has two signers, so each shipment brings in the next company on the route.

Same shape as Swift's published fees: entry, annual, per-message usage (swift.com, accessed 25 Oct 2026). Radox is not affiliated with Swift.

GO-TO-MARKET AND VISION

# One corridor first. Then every route.

### NOW

The rail and an open spec on Stellar testnet.

### NEXT

One financed shipment on US–Brazil, with a lender and a logistics operator. Then Stellar engineer review, SCF Build application, audit, mainnet.

### THEN

Every route. Each company joins once, through one adapter.

Our design target: US–Brazil goods trade, about US$94.2 billion in 2025 (US Census Bureau, exports plus imports).

TEAM

# Founder with 3 Soroban contracts on mainnet. This rail, built at the event.

**Pedro Wakigawa Saragossy**

Founder. Built the Radox platform before the event.

**Leo Schlanger**

Developer. Reviewed the contract's auth and signing logic. Signed testnet handovers.

**Vhendala**

Supervision and product review. Signed testnet handovers.

github.com/pwsaragossy/rio-miami-rail · rio-miami-rail.vercel.app

Radox is prior work. A Claude Code agent wrote the contract; Leo reviewed it (AI_USAGE.md).
