HACKMERIDIAN 2026 · SCALE TRACK

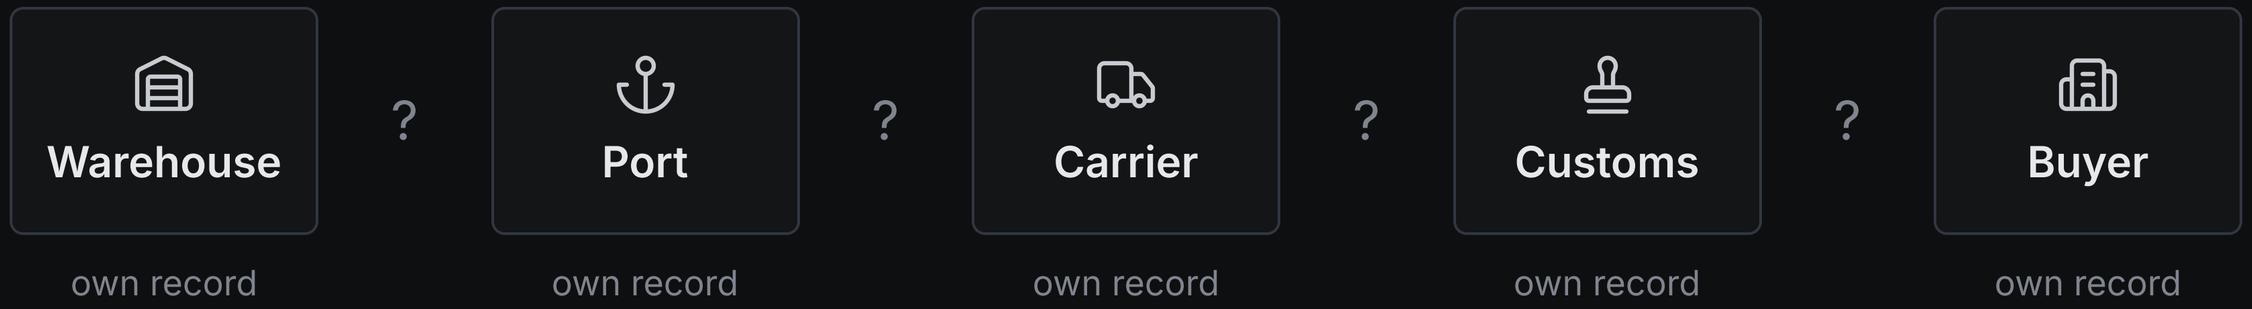

Radox Custody Rail

SWIFT for goods in transit, on Stellar

Every handover signed by both companies, checkable by anyone. Running on Stellar testnet.

PROBLEM

One container, five parties, five separate records.

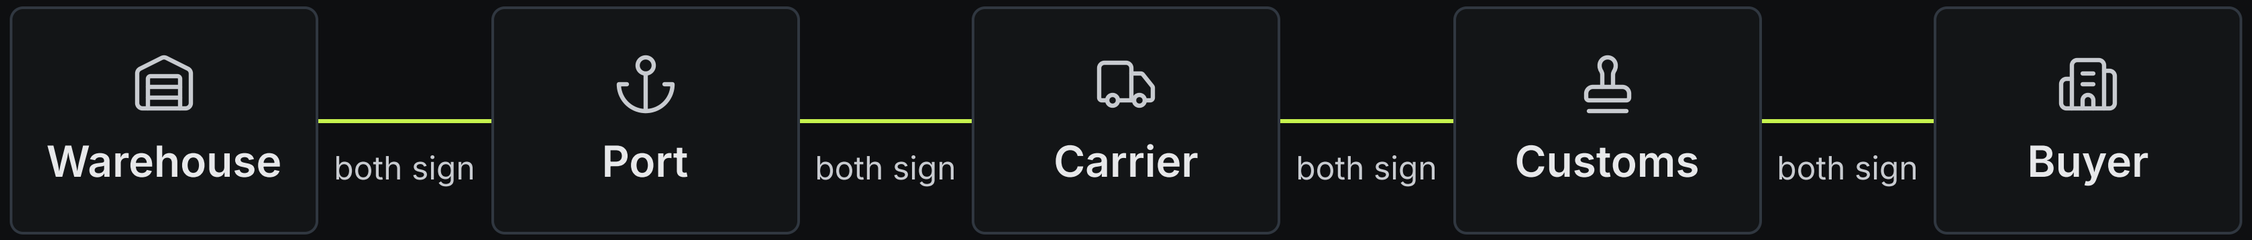

None of them can check what the others say about who held the goods.

The money that rides on those records is large: 80–90% of world trade relies on trade finance (WTO).

SOLUTION

One shared record. Both companies sign every handover.

Both sign

The company giving the goods and the one receiving them authorise the step.

Nobody rewrites

Each step folds into a hash chain. One 32-byte head commits to the whole history.

Anyone checks

A buyer, insurer or lender recomputes the head from public data.

TARGET USERS

The companies that hand over goods, and the ones that pay on them.

THEY SIGN

Warehouses, ports, carriers, customs, buyers

THEY CHECK

Buyers, insurers, lenders

And any Stellar issuer of a tokenized good, through the open spec.

VALUE PROPOSITION

Every handover becomes proof that lenders can check.

Lenders see the proof

Lenders and insurers will see which company last signed for the goods before paying.

Companies prove their leg

Your handover carries the receiver's signature, so you can show you passed the goods.

Cargo token, linked record

Each cargo token links to one shipment record of signed handovers.

Proof on Stellar testnet.

PROOF

It runs on Stellar testnet today.

7

transactions: one shipment from open to delivery and burn

9

refusal cases, each rejected in simulation (wrong signer, out of route)

26

contract tests

MATCH

anyone recomputes the head from Horizon

Dry run on a local copy of mainnet state, nothing sent to mainnet: 15 transactions applied, 9 refusals rejected, 13.72 XLM simulated fees.

MARKET OPPORTUNITY

The market around the rail: bills of lading, a financing gap, tokenized assets.

45M

ocean bills of lading issued a year

DCSA, Feb 2023

US$2.5T

global trade finance gap

ADB, Dec 2025

US$4B

tokenized real-world assets on Stellar

SDF, as of 1 Sep 2026

Market figures, not Radox volumes.

BUSINESS MODEL

The SWIFT model: pay to connect, pay per shipment.

SUBSCRIPTION

per connected company

FEE

per shipment on the rail

The shape follows Swift's published billing rules: entry fee, annual charges and usage fees (swift.com, accessed 25 Oct 2026). Radox is not affiliated with Swift.

GO-TO-MARKET AND VISION

One corridor first. Then every route.

NOW

The rail on testnet. An open spec any Stellar issuer can implement.

NEXT

First live shipment on the US–Brazil corridor. Mainnet after an audit.

THEN

Every route. Each company joins once, through one adapter.

US–Brazil goods trade was about US$94.2 billion in 2025 (US Census Bureau, exports plus imports).

TEAM

Built by people who already ship on Stellar.

Pedro Wakigawa Saragossy

Founder. Built Radox before the event: 3 Soroban contracts on Stellar mainnet (prior work).

Leo Schlanger

Developer: reviewed the contract, the signing logic and the proofs.

Vhendala

Supervision and product review.
