HACKMERIDIAN 2026 · SCALE TRACK

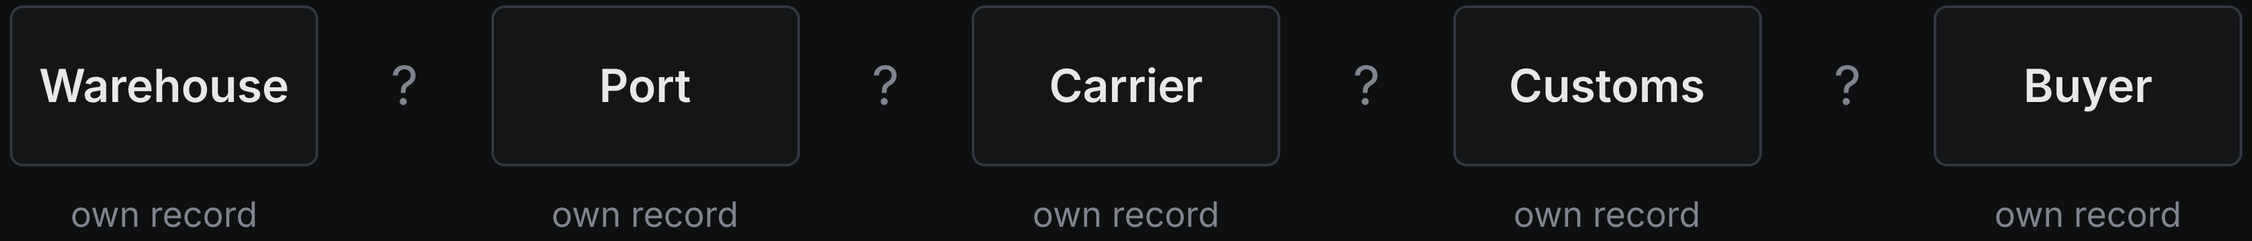

Radox Custody Rail

SWIFT for goods in transit, on Stellar

Every handover signed by both companies, checkable by anyone.

PROBLEM

One container, five companies, five separate records.

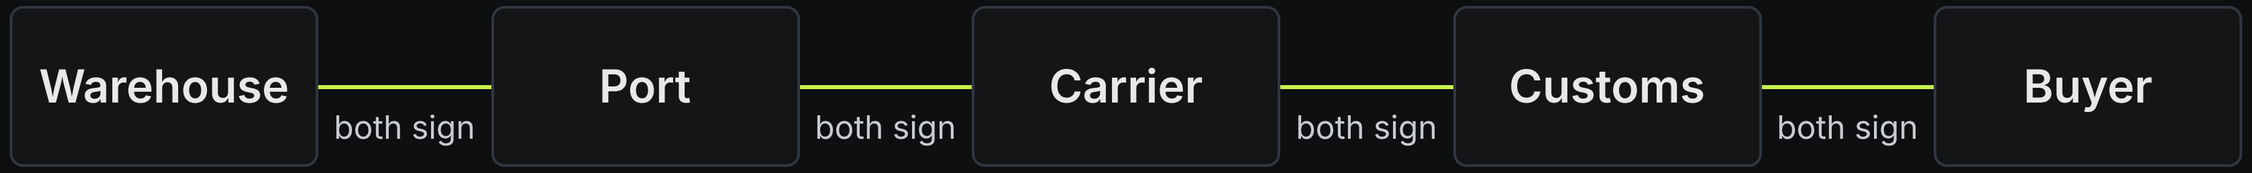

None of them can check what the others say about who held the goods.

The money that rides on those records is large: 80–90% of world trade relies on trade finance (WTO).

SOLUTION

One shared record. Both companies sign every handover.

Both sign

The company giving the goods and the one receiving them authorise the step.

Nobody rewrites

Each step folds into a hash chain. One 32-byte head commits to the whole history.

Anyone checks

A buyer, insurer or lender recomputes the head from public data.

TARGET USERS

The companies that hand over goods, and the ones that pay on them.

THEY SIGN

Warehouses, ports, carriers, customs brokers, buyers

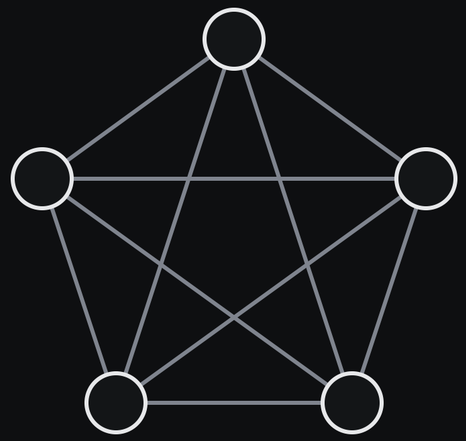

THEY CHECK

Buyers, insurers, lenders

And any Stellar issuer of a tokenized good, through the open spec.

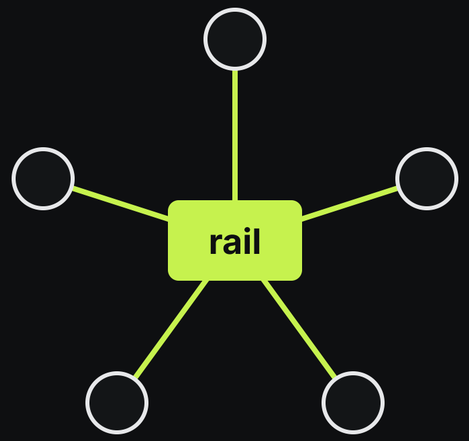

VALUE PROPOSITION

Each company connects once, not to every other company.

TODAY

10 links, pair by pair

ON THE RAIL

5 connections, one each

A lender sees which company last signed for the goods before it pays.

PROOF

It runs on Stellar testnet today.

7

transactions: one shipment from open to delivery and burn

9

refusal branches, each refused (wrong signer, out of route)

26

contract tests

MATCH

anyone recomputes the head from Horizon

Rehearsed on a local fork of Stellar mainnet: 15 transactions applied, 9 refusals refused, 13.72 XLM in fees.

MARKET OPPORTUNITY

The trade that runs on these records is enormous.

45M

ocean bills of lading issued a year

DCSA, Feb 2023

US$2.5T

global trade finance gap

ADB, Dec 2025

US$4B

tokenized real-world assets on Stellar

SDF, as of 1 Sep 2026

Market figures, not Radox volumes.

BUSINESS MODEL

The SWIFT model: pay to connect, pay per shipment.

SUBSCRIPTION

per connected company

FEE

per shipment on the rail

The shape follows Swift's published billing rules: entry fee, annual charges and usage fees (swift.com, accessed 25 Oct 2026). Radox is not affiliated with Swift.

One corridor first. Then every route.

NOW

The rail on testnet and an open spec any Stellar issuer can implement (Apache-2.0).

NEXT

First live shipment on the US–Brazil corridor with a lender and a logistics operator. Mainnet after an audit.

THEN

Every route. Each company joins once, through one adapter to the Radox API.

US–Brazil goods trade was about US$94.2 billion in 2025 (US Census Bureau, exports plus imports).

TEAM

Built by people who already ship on Stellar.

Pedro Wakigawa Saragossy

Founder. Built Radox: 3 Soroban contracts on Stellar mainnet.

Leo Schlanger

Developer: the custody_registry contract, the testnet harness and the proofs.

Vhendala

QA and product review: reads every deliverable as a judge would.
